Configuring an email catch-all in cPanel

Vincent (Vinnie) Curle - 2023-02-03 - [cPanel - Email](#)

Overview:

A "catch-all" is used to deliver all unroutable mail that is sent to your domain to a specific address. This allows you to receive mail even if the sender has a typo in your email address.

If you manage multiple email accounts within your cPanel service for the domain, it is best to [configure forwarders](#) as using a catch-all does not save copies and only forwards the mail to the default address.

Method:

1. Log into your cPanel hosting environment.
2. Navigate to the "**Default Address**" tool under the "**Email**" category.
3. Select the domain name you want the catch-all configured on from the drop-down list.
4. Select "**Forward to Email Address**" and in the fillable field enter the email address that you would like mail to be forwarded to.
5. Click the "**Change**" button to commit your changes.
