

Creating and managing host records in Domain Panel

Vincent (Vinnie) Curle - 2023-02-03 - Domain Panel

Overview:

Host Records (also known as Glue Records or Child Nameservers) can be configured in your Domain Panel account. You only need to configure a host record when you plan to host your own authoritative servers.

Creating a host record comes with some risks - as entering incorrect information can cause issues on your domain and within the Domain Panel management area. If you're not familiar with glue records and do not require custom dedicated records **we do not recommend making any changes to your domain's host records.**

If you do require host records, then ensure that you have completed any DNS requirements before going ahead with the configuration - as invalid records will cause errors on the domain.

Method:

1. Log into your Domain Panel account
2. Navigate to "**Domains**" and locate the domain you want to set host records for.
3. Click on the domain name, this will open a window, click "**Manage Host Records**"
4. Click "**Add Record**" to enter the required records.
 1. **Name:** The primary domain will be entered automatically and does not need to be typed in.
 2. **IP Address:** Add the required IPv4 address.
 3. **IPv6 Address:** Add the required IPv6 address.
 4. *NB: The record will fail if no IP addresses are added to the record.*
5. Click "**Save new Record**" to complete the update.
