Installing web apps using the Softaculous Apps Installer

Felix Lane - 2026-05-07 - cPanel Shared Web Hosting

Overview:

This guide details how you can install alternative content management systems and other applications within your cPanel hosting service using the Softaculous Apps Installer tool.

Method:

1. Authenticate your IP for access to cPanel
    1. In a web browser window, go to https://webhostauth.micron21.com
    2. Complete the reCAPTCHA challenge (the "I'm not a robot" box)
2. Log into your cPanel hosting environment.
3. Navigate to the "**Softaculous Apps Installer**" tool.
4. By default, a list of the "**Top Scripts**" will be displayed, such as WordPress and Joomla. You can click on any of these to review or install the Web App easily.
5. If the required Web App is not listed under 'Top Scripts" you can navigate to it using the drop-down menus or search bar on the right-hand side, and complete the installation this way.

Unfortunately, as the Micron21 Support team is not trained in Web Development for third-party applications and software - we may be limited in the amount of support that we can offer here. Please refer to the application-specific support team for information if you run into any issues after an application has been installed.
